

Keep Mosquitoes Out Of Your Septic Tank!

Mosquitoes can lay hundreds of eggs inside broken or improperly sealed septic tanks. Inspect septic tanks regularly to look for missing covers, cracks, gaps in blocks, or missing screens and perform any necessary repairs.

Cleanout access above the septic tank should be sealed and watertight. Makeshift lids, cracked PVC caps or broken/cracked concrete lids should be replaced and edges should be sealed tightly.

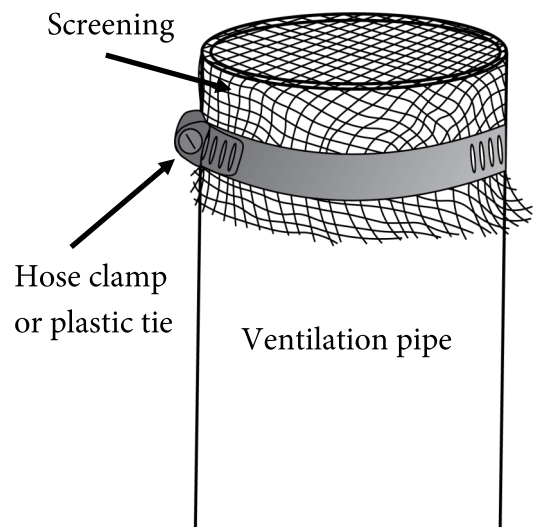

Mosquitoes can slip through even small cracks

Any saturated/wet ground because of drain field failure will act as a mosquito breeding ground and should be treated immediately with a bacterial larvicide containing Bti.

Ventilation pipes should be securely covered with screening. Observation pipes should be capped with a removable cap. Form the screen into a cone if the vent pipe is below or near a tree.
